Reports for Future Capacity Planning

How Ayetier helps customers capacity plan for future architecting and growth.

In enterprise IT, capacity planning is imperative to business. It helps CIO's, CFO's and VP's of Technology budget plan for the upcoming year, outlining personnel and resources the business will need to maintain current operations and reach future goals. Capacity planning aids in scalability, growth and dynamic change within the business. As year-end budget reviews close in, IT directors, storage administrators and data architects scramble to find proof of why they need a bigger budget or increased resources.

How Ayetier aids in capacity planning

In this specific use case, our customer, a national healthcare provider in North Carolina, needed a storage capacity report comparing the current year to the previous one. Their CIO requested a statement demonstrating how much their storage footprint was growing to prove budget requests were legitimate. Higher-ups needed a report that included information for the total number of systems, used capacity and provisioned storage.

Within minutes, Ayetier was able to create a comprehensive report, showing growth for all 42 NetApp systems, including total and provisioned storage for each system. The report validated the need to increase budget that year, while also giving both the IT team and management clear insight into their storage data.
