# How Ayetier Helps to Decrease Latency and Increase App Speed

Comprehensive insight into complex storage data helps companies quickly spot bottlenecks and fix issues quicker than before.

Latency is one of the biggest constraints for companies today, especially in enterprise IT. When we're able to reduce latency, we increase performance and we're able to provide customers with better business value.

Ayetier has proved in helping its customers decrease latency and increase application speed by providing comprehensive insight into complex storage systems. Ayetier's dashboard is simple: it's clean, easy to read and presents complex data through clear charts, graphs and maps. For our enterprise IT customers, Ayetier has become an invaluable tool in managing and monitoring storage data. Customers can quickly access the critical data they need from any device to gain insight into whether or not their systems are performing as expected.

Having better and more clear insight into their environment has allowed storage teams to respond faster to latency by pinpointing bottlenecks in less than 15 minutes. Quick detection of problem issues means teams are able to solve problems quicker than ever before.
